For your final project, you will choose any web site (preferably one that is poorly designed), and redesign it. You will need to reproduce the same content that is on the pages, but with your own design. For this challenge, you should pull out all of the stops, and use everything that you have learned about web design to this date, beyond even what you have learned in this class. If the web site is large, then you can choose the home page of the site, plus 2-3 additional pages (this is a minimum). You do not have to replicate the same page structure that the original site has. You are the designer - You take control of the design.

Tip: This project is your chance to show all of the things you have practiced in this class. Take advantage of them.

When you are done with the redesign of the site, you will need to post three things to the forum below:

1. The URL of the web site you are redesigning.
2. The URL of your redesign.
3. A 1-paragraph description of the changes you made to the site, and why you made them. Make sure you address the benefits and usability advantages of your version over the original.

This project is worth 50 points total. Points will be assigned using the following rubric:

10 Points The site follows good Information Architecture principals.
10 Points The page design uses fonts, images and color appropriately.
10 Points The site is created using appropriate tools and/or languages.
10 Points The site contains the full content from the original.
10 Points The design is submitted on time, and is designed you.
